

Product Description

Grounding module is a kind of combined grounding material which can prevent corrosion internally and reduce resistance externally. Metal bracket electrode core inside and solidified into corrosive proof material by means of high aluminosilicate. Then mixed with silicate is conducting material of electrolyte and electrode before being solidifying into grounding precast module ,It is easier for construction comparing with the Earth Improving Enhancing compounds. The high compact layer formed by maetal electrode and high aluminolilicate can Prevent all kinds of corrosions including sea water, and grounding module can hardly be impacted by dryness and humidity.

Feature of the Product

It is a fundamental guarantee to ensure various long term and stable grounding requirement under the condition of different temperature, dryness and humidith. It solves problems coexisted in both resistance reduction performance and corrosion . Especially, it is more convenient for grounding in high mountains where water is in shortage. It can withstand large current impact without deformation and changing performance and can be operated in a long time.

Products	Model	Dimension	Net Weight
Strong focus type grounding module	Y-1	150x1000mm	26
	Y-2	170x800mm	30
	Y-3	260x1000mm	50
	F	500x400x600mm	20
